LOSS OF BOWEL CONTROL?
BE YOURSELF AGAIN
You are not alone

1 in 5 women over 45 have experienced loss of bowel control.¹

Symptoms associated with loss of bowel control can vary:

• **Urgency**: Sudden, strong urge to have a bowel movement
• **Passive soiling**: Leaking stool without knowing it
• **Incomplete emptying**: Remaining stool leaks out later
• **Staining in undergarments**
• **Constantly going to the bathroom**

“My life was controlled by my bowels. I lived my life in fear of my next accident.”

— PATTY, AGE 39*
The pelvic muscles support the bladder, rectum, and uterus. When these muscles are damaged, such as with pregnancy or childbirth, it can lead to three main pelvic floor issues: prolapse, loss of bladder control, and loss of bowel control. Women are also more likely to experience loss of bowel control if they have a history of Irritable Bowel Syndrome or other gastrointestinal conditions.
Loss of bowel control is treatable

**Lifestyle**
- Diet modification
- Supplements/medications
- Diapers/pads

**Non-Surgical**
- **Eclipse System**
  - Pelvic floor physical therapy
  - Bulking agent injections
  - Anal plugs

**Surgical**
- Sphincter repair
- Sacral Nerve Stimulation
Control is in your hands
Introducing the Eclipse System

DESIGNED FOR A WOMAN’S BODY
Vaginal insert that uses the body’s natural anatomy

NO SURGERY REQUIRED
Just a simple office visit to find your correct size

IMMEDIATE RESULTS
Works as soon as it’s in place
Comfortably fit to your body

In the LIFE clinical study, 86% of women who were successfully fit with an Eclipse reported that it was successful, after completing a 1-month study. 96% of these women also reported Eclipse was comfortable, or that they couldn't even feel it, and 98% also reported that they would recommend Eclipse to a friend.²
Try Eclipse for a week

Before committing to the Eclipse System, you will have the opportunity to use a Trial Insert at home for a week or so. Use this trial period to decide if the Insert fits well and is right for you. Don’t forget, you can remove Eclipse yourself anytime so you’ve got nothing to lose!
**ECLIPSE SYSTEM IMPORTANT SAFETY INFORMATION**

**Indications for Use**
The Eclipse System is indicated for the treatment of fecal incontinence in adult women. It is intended for prescription use.

**Contraindications**
The Eclipse System is contraindicated in the presence of a vaginal infection or open vaginal wound.

**Warnings**
The Insert should be removed before obtaining an MRI to avoid adverse events. Women should consult a doctor before obtaining a pelvic X-ray since the Insert may obscure images. The Insert and the Pump are for single-patient use only. Sharing the devices could result in transmission of disease and/or infection. Women should remove the Insert immediately and notify their doctor if they experience any of the following: a foul odor or excessive vaginal discharge, difficulty urinating or defecating, significant bleeding not associated with menstruation, or any new onset or worsening pelvic pain or discomfort.

**Risks**
In a clinical study of the Eclipse System, 117 women participated in the fitting process, and 61 women were successfully fit and entered a 1-month Treatment Period evaluation. Among the 61 women who entered the Treatment Period, there were no serious device-related adverse events. The most common adverse event was pelvic cramping and discomfort, and other observed events included pelvic pain, vaginal spotting and urinary incontinence. All adverse events were rated as mild or moderate, and lower rates of adverse events were observed after the initial Fitting Period was complete. All adverse events were resolved without surgery or significant intervention; most simply required removing the insert.

Please refer to the Eclipse System Instructions for Use (www.eclipsesystem.com/IFU) for a complete discussion of risks, contraindications, warnings, and precautions.
